# Overview

We built the My Form Editor to allow you to easily describe your address form, field widths and required fields, then we apply our *Address Intelligence* to ensure addresses returned are compatible with these requirements.

Choose Settings in your integration and then choose the *My Form* tab.

You'll see an address form editor similar to the one below, which will default to your integration default country.

Country layout

🇺🇸 United States	▶

Address lines		Max characters	Required field?	Advanced settings	API field returned

Add +

Line 1

Delete

Street address, P.O. Box	100	☐		AddressLine1

Line 2

Delete

Flat, suite, unit, building, floor etc.	100	☐		AddressLine2

City

Enter city	100	☐		City

State

Enter state	100	☐	⚙	Region

ZIP Code

Enter ZIP Code	100	☐		Postcode

By default, the form is set up to have two address lines above City, Region and Postcode fields. You can add a separate Organization field and/or additional address lines.

CHOOSE ADDRESS FIELDS ⊗

Address Lines

⬜	Organization
🔵	Line 1

Cancel   **Save**

Simply fill in the details of your requirements and we'll do the rest. We return an **address object** that is compliant with your address form, all mandatory fields completed, field widths respected (we abbreviate where possible before truncating).

In the case of the German example address below we've duplicated the City field into the Region field as German addresses do not include a Region/State.

type	lookup
message	[+] **message { }**
address	[-] **address { }**

id	DE27600001051221	
language	de	
charset	Latn	
lines	[-] **lines [1]**	

☰	key	value
1	AddressLine1	Hinterseer Straße 30

city	[-] **city { }**
	value	Ramsau bei Berchtesgaden

region	[-] **region { }**
	value	Ramsau bei Berchtesgaden

postcode	[-] **postcode { }**
	value	83486

country	[-] **country { }**
	language	en
	value	Germany
	iso	DE

label	[-] **label [3]**
1	1	Hinterseer Straße 30
2	1	83486
	2	Ramsau bei Berchtesgaden
3	1	GERMANY

data	[+] **data { }**
links	[+] **links [2]**

We also return a **label object** that returns the address how it should optimally appear on an address label. If multiple elements are on one line, such as postcode and city on line 2 above, we return them as an array that you can use to create a single line with a space between the array elements.

For granular control, you can customize options for multiple countries. If you see a ⚙ option beside a field that means it has advanced settings. For example, for US addresses the Region field provides an option to return full state names rather than the default two letter abbreviation.

REGION - UNITED STATES   ✕

Use Full State Name   ⬤

                                              Cancel   **Save**

These advanced options are available for a number of countries, just choose the country from the dropdown list. Examples include:

- UK - Return the country name (England, Scotland, Wales, Northern Ireland) in the Region field.
- Ireland - Remove the space from the Eircode (postcode).
